Freelance Starter Kit - Kunal (TradingView & broker automation builder)

Made 12 Nov 2026. Everything here is ready to copy-paste. Change only the parts in [brackets].

---

1. What you sell (your one-line position)

"I build custom TradingView indicators, backtests and broker automation (FYERS, Zerodha, Dhan) for traders."

Why you: you trade, you read charts, and you have already built working tools (KTMI Cross over, BB Reversal R:R, Position Sizer, and a full FYERS trading terminal with backtests and a kill switch). You understand what a trader actually needs - most developers do not.

The one rule you never break (SEBI): **you build tools, you never give trade calls.** No "buy this", no tips, no "this indicator makes 80% profit". Every delivery says: "This is a software tool. It is not investment advice."

---

2. Fiverr

Gig 1 (start with this one)

Title (max 80 characters): I will code a custom TradingView Pine Script indicator or strategy with alerts

Category: Programming & Tech > Software Development (or the "Trading" / "Pine Script" sub-category if offered)

Search tags (5): pine script, tradingview, tradingview indicator, trading strategy, tradingview alerts

Packages (launch prices - raise them after 5 good reviews):

	BASIC	STANDARD	PREMIUM
Name	Simple indicator	Advanced indicator	Strategy + backtest
What	1 idea, settings, alerts	several conditions, settings, alerts, signal arrows, info table	full `strategy()` with entries, stop, target, breakeven, backtest report - or a conversion from MT4 / another script
Delivery	2 days	3 days	5 days
Revisions	1	2	3
Launch price	$30	$70	$140
Price after 5 reviews	$60	$150	$300

(Fiverr keeps about 20% of each order. Market prices for this work are roughly $75-300 for a simple indicator and $300-800 for a complex one - you start lower only to collect reviews.)

Gig description (copy-paste):

Need a TradingView indicator or strategy built exactly the way you trade? I am a trader and a Pine Script builder, so I understand what you mean by "candle closes outside the band", "move the stop to breakeven at 1:1" or "only signals above the zero line" - you do not have to explain trading to me.

What I build

- Custom indicators (Pine Script v6) with clean settings - nothing hard-coded
- Buy / sell arrows, risk-to-reward boxes, results tables
- Alerts that fire on candle close (no repainting surprises)
- Strategies with stop loss, target, breakeven and a backtest report
- Conversions: MT4 / MT5 / another TradingView script / FYERS Smart Script
- Fixes and changes to your existing script

How we work

1. You describe the rules (a screenshot with marks helps a lot).
2. I confirm the rules back to you in plain words before coding.
3. You get the full source code, a short user guide and the settings explained.

Every script is tested on real charts before delivery.

Note: I build software tools. I do not give trading advice or buy/sell calls.

FAQ (add these 4):

- Will I get the source code? Yes, the full Pine Script code is yours.
- Do your indicators repaint? Signals are taken on the closed candle, so they do not change after the candle closes.
- Can you make it work on my timeframe/market? Yes - stocks, indices, options, crypto, forex, any timeframe.
- Do you guarantee profits? No. Nobody honest can. I guarantee the tool does exactly what your rules say.

Requirements (questions the buyer must answer):

1. Describe your rules step by step (entry, exit, stop, target).
2. Which timeframe and which symbols do you use?
3. Any screenshot of a chart with the signals marked? (optional but very helpful)
4. Do you need alerts? Arrows? Boxes? A results table?

Gig 2 (add after the first 3-5 reviews)

Title: I will connect TradingView alerts to FYERS, Zerodha or Dhan for automated limit orders

Short description:

Your TradingView alert places a real order at your broker - limit orders with a price buffer, stop loss, target, daily loss limit and a kill switch. Runs on your own PC with your own API keys (they never leave your computer). Includes paper-trading mode to test safely first. Note: Indian brokers need a whitelisted static IP for API orders (SEBI rule) - I guide you through it.

Packages: $100 / $220 / $450 (paper mode only / live with 1 instrument / multi-index with dashboard).

---

3. Upwork profile

Title: TradingView Pine Script Developer | Trading Automation | FYERS, Zerodha, Dhan APIs

Hourly rate: start at **$20/hour**, move to $30 after 3 good reviews, $40+ after 10.

Overview (copy-paste):

I build trading tools for traders - and I am a trader myself, so you will not have to explain what a "breakout on candle close" or "stop to breakeven at 1R" means.

What I do:

- Custom TradingView indicators and strategies (Pine Script v6): signals, alerts, risk/reward boxes, results tables
- Backtests with real costs (slippage, brokerage, taxes) and clear reports
- Conversions from MT4/MT5 or other scripts to TradingView
- Broker automation for Indian markets: TradingView or your own signals -> FYERS / Zerodha / Dhan API, limit orders only, stop loss, daily loss limit, kill switch, paper-trading mode first
- Dashboards to watch your trades live

Recent work:

- A Bollinger Band reversal indicator with 5 selectable setups, risk/reward boxes, breakeven logic and a results table
- A momentum cross-over indicator with an adjustable signal filter
- A position-size calculator (capital limit + risk limit, whole lots)
- A full trading terminal for FYERS: live option chain, charts, automated strategy, backtests on real option prices, drag-to-modify stop orders and a one-click kill switch

How I work: I write your rules back to you in plain words before I code, so we agree first. You get full source code, a short guide, and fixes if anything does not match your rules.

I build software. I do not give trading advice.

Skills to add: Pine Script, TradingView, Python, Algorithmic Trading, Trading Automation, API Integration, Backtesting, Technical Analysis, Data Visualization, Streamlit

Portfolio (3 items, each with 2-3 screenshots + 3 lines of text):

1. BB Reversal R:R indicator (screenshot of boxes + table on a chart)
2. Position Sizer (screenshot of the lines + table)
3. FYERS Trading Terminal (screenshots of the terminal, backtest report, risk desk) - Show screenshots only. Never share your FYERS keys, token or code with private strategy rules.

---

4. Five proposal templates (Upwork)

Rules: answer within the first hour of a job being posted, keep it short, start with THEIR problem, end with ONE question. Send 3-5 good proposals a day, not 30 bad ones.

A. New custom indicator

Hi [name], I read your rules: [repeat their rule in one line, e.g. "arrow when the candle closes outside the upper Bollinger band and RSI is above 70"]. I am a trader and a Pine Script builder, so I can build this exactly, with settings for every number, alerts on candle close, and [extra they would like, e.g. a results table]. I recently built a similar Bollinger reversal indicator with risk/reward boxes and breakeven logic - happy to show a screenshot. One question before I start: [e.g. "should the signal wait for the candle to close, or fire during the candle?"] Delivery: [2-3] days. - Kunal

B. Conversion (MT4/MT5/other platform -> TradingView)

Hi [name], I can convert your [MT4 indicator name] to TradingView Pine Script v6 and check it candle by candle against the original so the values match. You get the full code and a short note on any differences between the platforms (for example how each one calculates [EMA/ATR]). Could you share the source file (.mq4) or, if you only have the compiled file, screenshots with values? Delivery: [3] days. - Kunal

C. Fix or change an existing script

Hi [name], I can fix this. From your description the problem looks like [e.g. "the signal repaints because it uses the live candle"] - I will confirm once I see the code. You will get the corrected script plus a one-line explanation of every change. Can you share the script and one screenshot where it goes wrong? Usually done within [24 hours]. - Kunal

D. Alert -> broker automation (India)

Hi [name], I have built this for FYERS myself: TradingView/our own signals -> limit orders with a buffer (never market), stop loss at the exchange, daily loss limit, kill switch, and a paper-trading mode to test first. It runs on your PC with your own API keys. Important: Indian brokers now require a whitelisted static IP for API orders - do you already have one? Which broker do you use ([FYERS/Zerodha/Dhan]) and which instruments? - Kunal

E. Backtest a strategy

Hi [name], I can backtest [their strategy] on [market/timeframe] with realistic costs (slippage, brokerage, taxes) and give you a clear report: win rate, profit factor, drawdown, equity curve, results by day and by hour, and every trade listed. I trade myself, so I will flag anything that looks too good to be true. How many months of data would you like, and do you trade the [index/stock] itself or options on it? - Kunal

---

5. Publishing your 3 scripts on TradingView (your shop window)

TradingView's House Rules for scripts, in short: original work, a clear English description of what it does and how to use it, a clean chart that shows only your script, no links, no advertising, no contact details, no profit promises. Breaking them gets the script hidden - read the rules on TradingView once before you publish.

How to publish: open the script in the Pine Editor -> Add to chart -> clean the chart (remove other indicators) -> "Publish script" -> choose visibility -> paste the title and description below -> Publish.

Script 1: BB Reversal R:R - publish OPEN-SOURCE

Title: BB Reversal R:R - Bollinger band reversal setups with risk/reward boxes and breakeven

Description:

This indicator marks Bollinger Band reversal setups and draws the full trade plan for each one: entry, stop, target, and a breakeven move.

How it works

- Bollinger Bands with adjustable length, multiplier, source and average type (defaults 20 and 2).
- Five setups you can tick on or off: (1) candle opens and closes outside the band, (2) candle closes outside, (3) the previous candle closed outside and this one closes back inside, (4) wick outside but close inside, (5) the whole candle (open, high, low and close) outside the band.
- Upper band = short setup, lower band = long setup (mirror image).
- Entry at the close of the signal candle. Stop at the candle's high (short) or low (long), with an optional buffer.
- Target at an adjustable R multiple (default 1:2). Optional move of the stop to breakeven once price reaches 1R.
- One trade at a time. Green box = reward zone, red box = risk zone. A table shows trades, targets, stops, breakevens, win rate and net R.

Notes: signals are taken on closed candles. If the stop and the target are touched inside the same candle, the default assumes the stop (you can change this). This is an educational/analysis tool, not trading advice.

Script 2: Position Sizer - publish OPEN-SOURCE

Title: Position Sizer: capital + risk limit, whole lots, R:R target

Description:

> How many lots should a trade be? This tool answers with two limits and takes the smaller one, in whole lots:
> - Capital limit: capital x allocation % / (entry x lot size)
> - Risk limit: max risk / (distance to stop x lot size)
>
> Click your entry and stop on the chart when you add it (drag them any time). The target follows your R:R. A table shows lots, quantity, which limit decided the size, money used, rupee risk and reward. "Strict" mode adds the limit-order buffer to both sides so the real loss stays inside your cap. Works for options (entry = premium), futures and shares (lot size 1). It only calculates; it places no orders.

Script 3: KTMI Cross over - DO NOT publish the code openly

KTMI is your own strategy indicator - your edge. Options, safest first:

1. **Keep it private** (recommended for now) and only show screenshots in your portfolio.
2. Later, publish it as **protected** (people can use it, the code stays hidden) or **invite-only** (you choose who can use it - this is how indicator sellers charge a monthly fee). Check your TradingView plan for which options it allows.

Use these instead as script 3 for now: any small free utility a client asks for often (for example a "previous day high/low + opening range" indicator). I can build it for you.

---

6. Your weekly routine (2-3 hours on weekdays, 6 on weekends)

When	What
Every weekday morning (30 min)	Upwork: read new jobs for "pine script", "tradingview", "trading bot", "algo"; send 1-2 proposals
Every weekday evening (1-2 h)	Deliver work; improve one portfolio piece
Saturday (3 h)	Build or improve one public script / sample; write one helpful answer in a trading community
Sunday (3 h)	Review the week: proposals sent, replies, orders, money earned; plan next week

Track it in one simple sheet: date - platform - job - proposal sent? - reply? - won? - amount.

Targets: month 1 = profiles live + 3 published scripts + 40 proposals; month 2 = first 3-5 orders (reviews); month 3 = Rs 30-60k; then raise prices.

---

7. Money basics

- Fiverr/Upwork pay in USD; withdraw to your Indian bank (directly or via Payoneer). Keep every invoice.
- Freelance income is taxable. Once it becomes regular, talk to a CA once (they will also tell you about GST for export of services).
- 50% of every rupee earned goes to the loans (highest interest first) until they are gone.
- Keep the job until freelance income equals your salary for 3-6 months in a row.
